**DB009: Cdc2 p34 (C20)**

**Background:**
Cyclin dependent kinases are key regulators of the progression of the cell cycle. Early in the cell cycle Cdk2, Cdk4, Cdk6 and their associated cyclins regulate the G1 to S phase transition (1, 2). Cdk2 plays a key role in the G1/S and S/G2 transitions through its associations with cyclin D1, cyclin D2, cyclin D3, cyclin E and cyclin A. Cdk4 also forms complexes with the D type cyclins, and is thought to regulate cell growth through the G1 phase of the cell cycle (3-6). The late stages of the cell cycle are regulated by another cyclin dependent kinase, Cdc2 p34. This kinase exists as a complex with both cyclin A and cyclin B. The best characterized of these associations is the Cdc2 p34-cyclin B complex that is required for the G2 to M phase transition (7,8).

**Origin:**
Cdc2 p34 is provided as an affinity purified rabbit polyclonal antibody, raised against a peptide mapping to the carboxy terminus of human Cdc2 p34.

**Product Details:**
Each vial contains 200 µg/ml of affinity purified rabbit IgG, Cdc2 p34 DB009 (C20), in 1 ml PBS containing 0.1 % sodium azide and 0.2% gelatin.

**Competition Studies:**
A blocking peptide is also available, DB009P, for use in competition studies. Each vial contains 100 µg of peptide in 0.5 ml PBS with 0.1% sodium azide and 100 µg BSA.

**Specificity:**
Cdc2 p34 DB009 (C20) reacts with Cdc2 p34 of mouse, rat, and human origin by western blotting, immunoprecipitation and immunohistochemistry.

**Storage:**
Store this product at 4º C, do not freeze. The product is stable for one year from the date of shipment.
